

Employment Growth, 2001-2006.

Eastern Ontario Communities

This chart displays the percentage change in the number of people working in the community from 2001 to 2006. A notable exception is people without a fixed workplace address. They are excluded from the analysis because their workplace location cannot be determined.

Local Competitiveness, 2001-2006.

Eastern Ontario Communities

Local competitiveness is measured as the community's employment growth rate from 2001-2006 less the Canadian employment growth rate over the same period (adjusted for the community's industry mix relative to the Canadian economy and corrected for the local share of employment in each industry). A positive value suggests that the community added jobs in excess of the national rate due to some local advantage(s). A negative value suggests that the community did not keep pace with national employment growth due to some local disadvantage(s).

Industry Specialization, 2001-2006.

Prince Edward County

Specialization is measured as the percentage of local jobs in the industry divided by the percentage of Canadian jobs in the industry. A score of 1 indicates that Prince Edward County has the same proportion of employment in the industry as the Canadian economy; scores higher than 1 indicate specialization; scores below 1 indicate under-specialization. Bubble size denotes sector size in terms of employment.
